

Non-Photorealistic Rendering

Interacting with NPR

Tobias Isenberg

Overview: Interactivity in NPR

- rendering speeds to achieve interactive to real-time image refresh rates
 - challenge in most computer graphics
 - challenge, in particular, in NPR (despite GPUs)
 - sometimes need to render less (screen space)
 - but need to figure out **what to render**
 - sometimes **many primitives** (strokes) to consider
- interaction models for affecting parameterization
 - not good: huge parameter lists, sliders, buttons, fields, ...
 - important: intuitiveness and usability
 - interactivity needs to be incorporated in the process

Interacting with NPR: General Areas

- interaction with stroke-based rendering
 - interacting/drawing with strokes
 - hardware-driven interaction
 - triggering algorithmic response
 - other related interaction approaches
- not a clear classification

Interacting with NPR

Interaction with Stroke-Based Rendering and Strokes
Simulating the Artistic Environment

Interacting with NPR

- first: three general areas together
 - interaction with stroke-based rendering
 - interacting with strokes
 - simulating the artistic environment/
hardware-driven interaction
- not always a clear distinction
- introduction of several approaches

Interaction with Stroke-Based Rendering

- interaction for user-controlled application of SBR with Lloyd's method
 - brushes for relaxation, jittering, stipple shape, new points
 - artists can control the relaxation process precisely
 - local, spatially explicit control of the SBR process

Interaction with Stroke-Based Rendering

- RenderBots: user-controlled semi-automatic SBR
 - several layers of input data
 - RenderBot: local agent, can read input layers, sees its local neighborhood
 - iterative process, motion and rendering based on type, input data, local configuration
 - stipple bots: Lloyd's method
 - line bots: follow edges
 - mosaic bots: line up with edge-derived vector field
 - painting bots: render themselves as paint brushes

Interaction with Stroke-Based Rendering

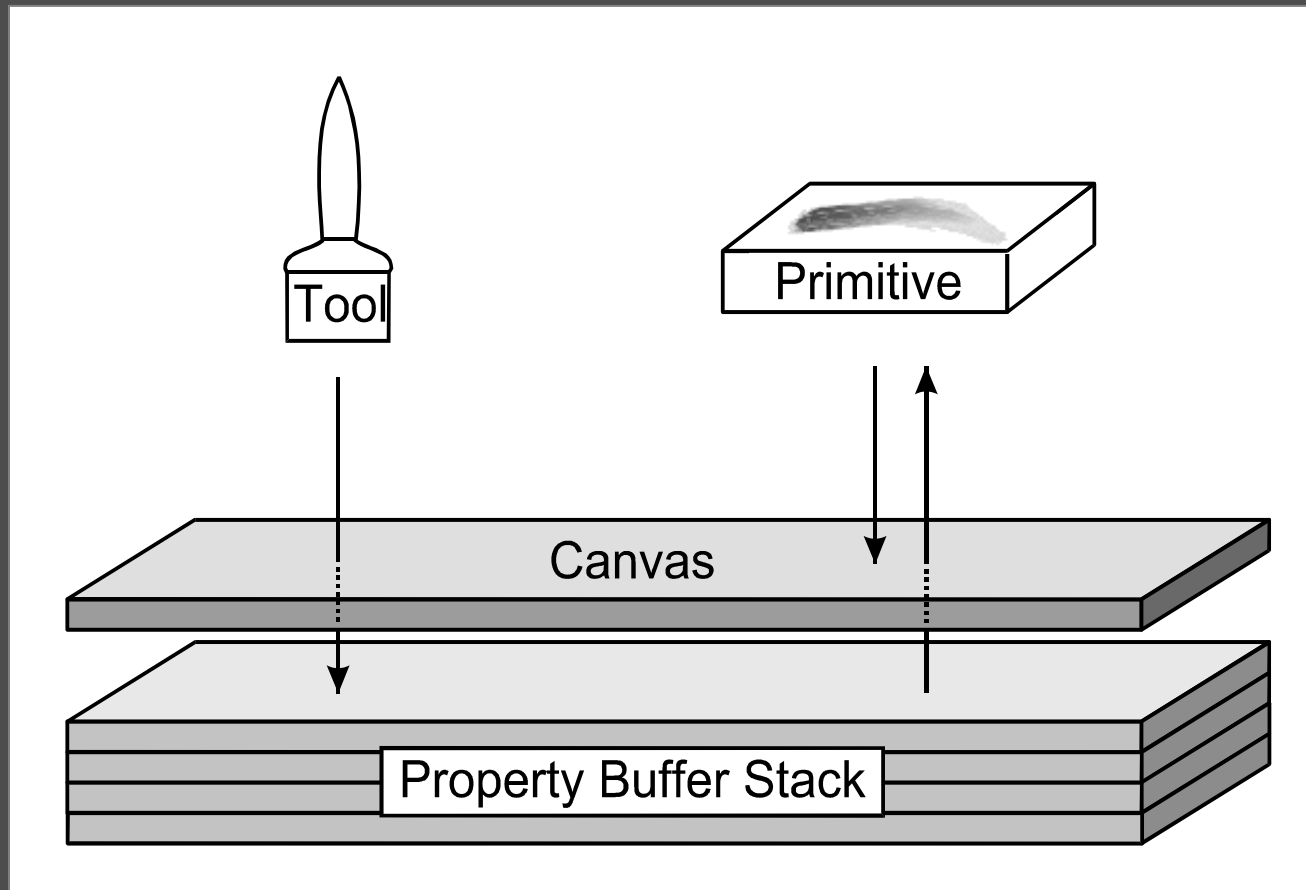

Interaction with Stroke-Based Rendering

Interaction with Stroke-Based Rendering

- interactive manipulation of data layers that control the strokes: use of interaction buffers (i-buffers)

Controlling Objects through i-Buffers

Persistent vs. Instantaneous i-Buffers

Interaction with SBR via Hand Postures

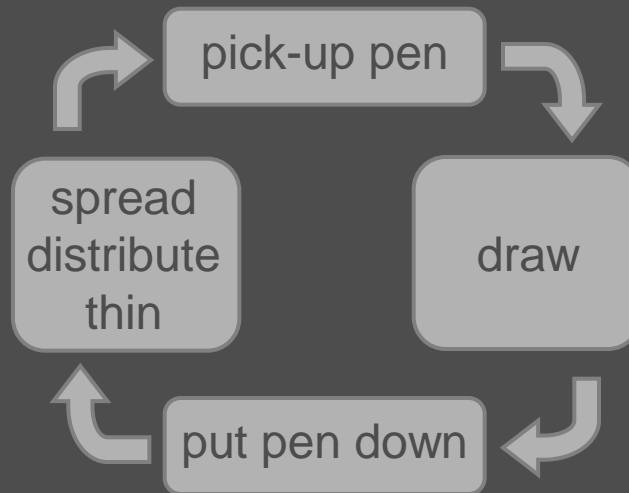

Interaction with SBR via Hand Postures

- direct-touch interaction for stroke placement

- direct-touch interaction for stroke creation

Interaction with SBR via Hand Postures

[Haeberli 1989]

- initial line parameterization through postures
- line control through drawing speed

Interaction with SBR via Hand Postures

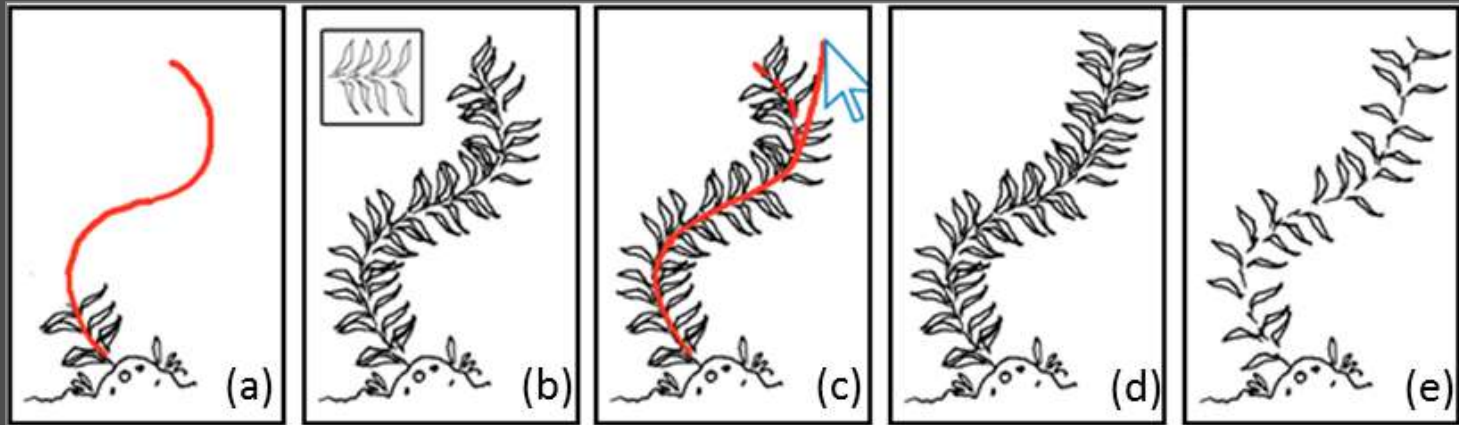

with J. Grubert & S. Carpendale

Interaction with SBR via Hand Postures

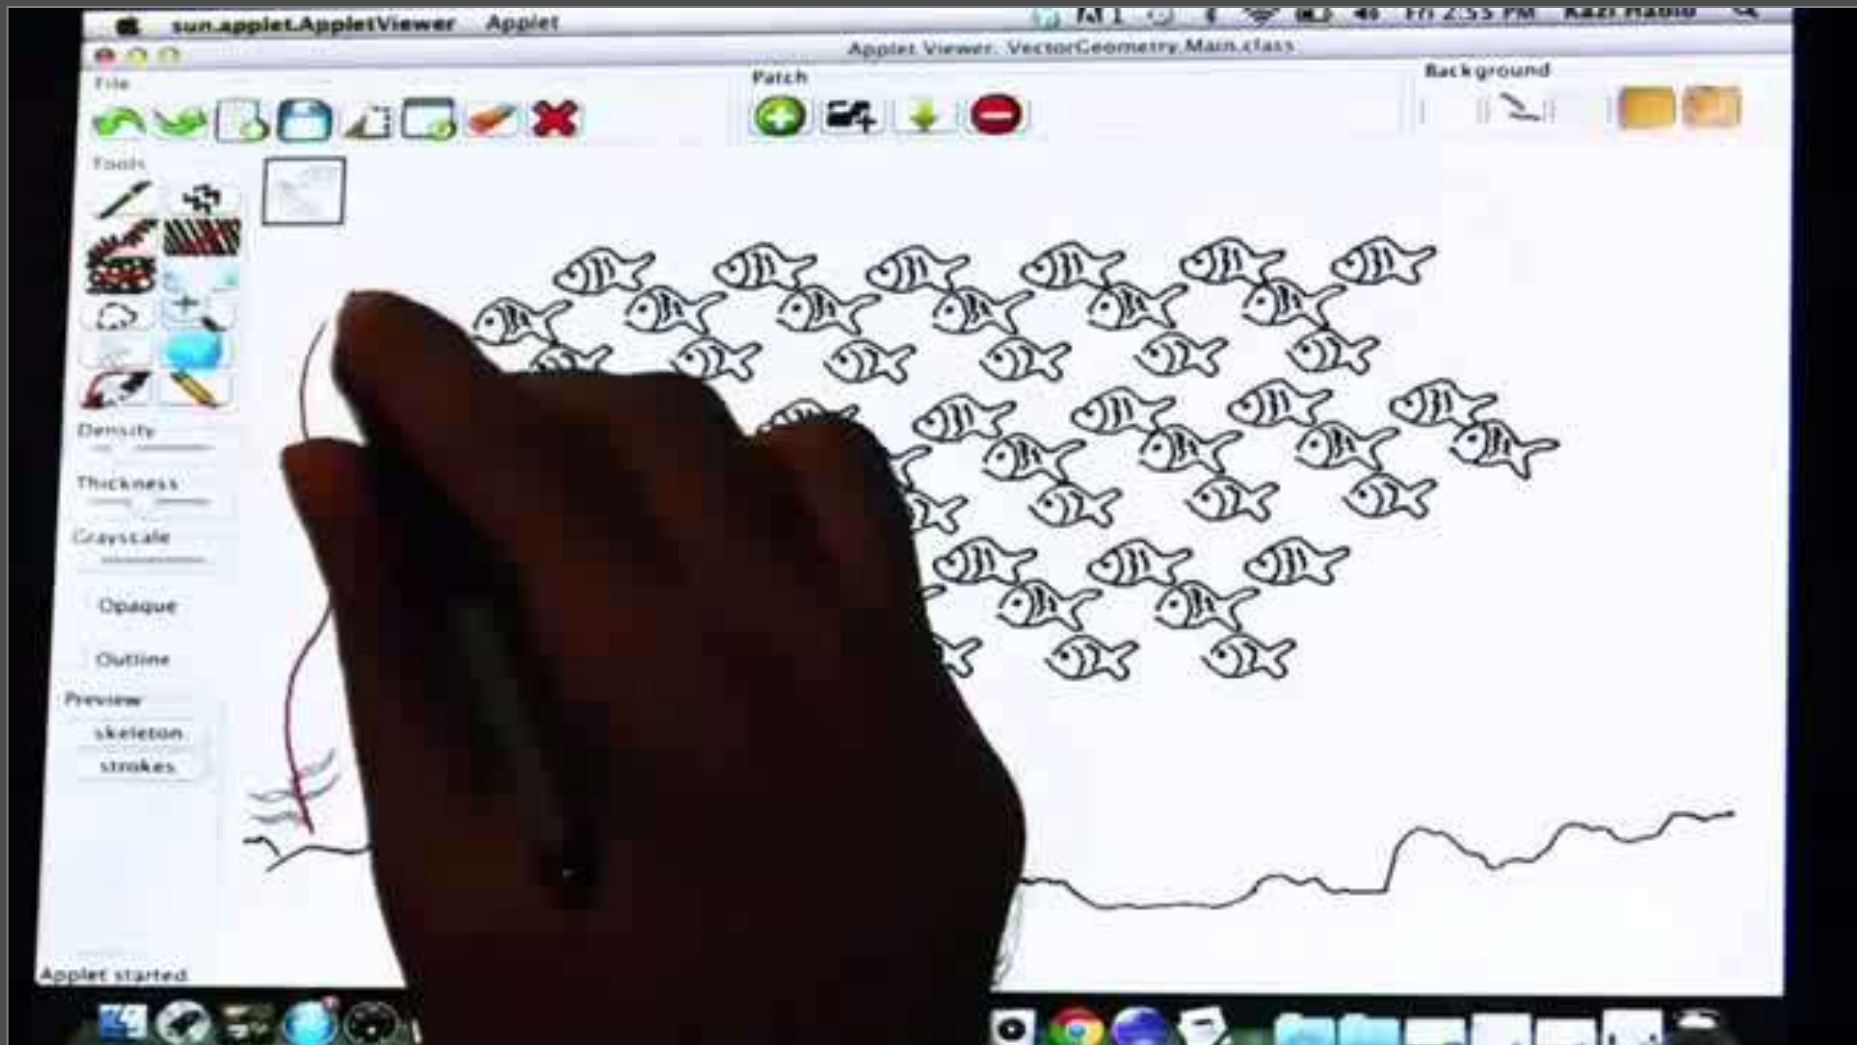

Automation of Tedious Stroke Placement

- many NPR approaches – simulation of styles that repeat strokes many times, with small changes: stippling, hatching, more complex textures
- placing them is tedious and can be automated if placement depends on measurable properties (e.g., brightness, curvatures as in stippling/hatching)
- sometimes more control of interactive placement needed:

Kazi et al., 2012

Automation of Tedious Stroke Placement

Kazi et al., 2012

Interacting with Strokes

- so far: interactive control for largely automatic SBR
- other domain for user interfaces in NPR: interactive control for largely automatic sparse line rendering
- interaction goals:
 - stroke stylization
 - abstraction and emphasis
- interaction challenges:
 - intuitive “style” specification
 - spatially explicit control
 - local changes

Interacting with Strokes: WYSIWYG-NPR

- example-based stylization of sparse line drawings rendered from 3D shapes
- interaction tasks
 - interact with the view on the model
 - draw directly onto a surface
 - specify an example style to be used for one line or to be propagated to all lines (rubber-stamping or example-based synthesis)
 - direct specification of stroke textures on the surface
 - specify local illumination (shadow, highlights)

Interacting with Strokes: WYSIWYG-NPR

Michael Kowalski Joe Lee Phil Davidson
Matthew Webb John Hughes Adam Finkelstein

[SIGGRAPH 2002]

Interacting with Strokes: NPR Lenses

- problem: global stylization of line properties
- idea: use distortion lenses for two purposes
 - provide the local, spatially explicit control
 - provide the gradual parameter change

- lens
 - 2D object, lives on the screen
 - has effect in projected 3D space

Interacting with Strokes: NPR Lenses

with P. Neumann & S. Carpendale

with P. Neumann & S. Carpendale

Interacting with Strokes: Abstraction

- interaction for controlling abstraction and emphasis

Interacting with NPR

Hardware-Driven Interaction

Interactively Drawing Strokes

- “traditional” platforms
 - mouse (not very intuitive for drawing)
 - tablets (used by many artists)
- novel platforms
 - large displays
 - CAVE VR environments
 - table-based VR environments
 - haptic feedback devices
 - dedicated devices that simulate the traditional experience

3D Freeform Sketching in VR

- drawing with hand directly in 3D environment
- interactive assembly of 3D surface model

Schkolne et al., 2001

Cave Painting & Drawing on Air

Keefe et al., 2001 and 2007

I/O Brush: Textures from the Real World

- so far: focus on how to interact with strokes
- easy acquiring of textures for brush strokes from the world around us
 - intuitive capturing
 - intuitive use of textures
- used application similar to typical painting environment
- aimed specifically as an interface for children

I/O Brush: Textures from the Real World

I / O B r u s h

Ryokai & Marti
MIT Media Laboratory (C) 2005

Simulating a Realistic Environment

- traditional painting:
 - intuitive interface
 - parameters easy to control
- digital painting:
 - more parameters (good and bad)
 - digital advantages (e.g., undo, save, ...)
- goal: combine these into one interface
 - similar in interaction as the real canvas
 - using touch-sensitive surfaces
 - using interaction tools similar to real painting

A Realistic Environment: IntuPaint

- brushes: fiber-optic bristles
IR-based tracking of brush position & touching shape

- slightly tilted vertical display
- back-end: simulation of paint
- simulates oil painting with realistic feedback

Side Note: FTIR to Detect Touch

- Frustrated Total Internal Reflection (Han, 2005)

Han, 2005

- domains: tables & (large) walls (e.g., CNN etc.)
- can detect many simultaneous touches
- easy to build

A Realistic Environment: IntuPaint

Special Artistic Style: Sand Canvas

- direct-touch platforms useful for other interactive expressive media: sand canvas/sand painting
 - traditional expressive & highly interactive art
 - simulation of sand being applied to and interacted with on an illuminated and projected surface
 - NPR: combination of the simulation of the sand medium and the interaction with it, using the specific affordances of direct-touch surface interfaces

Special Artistic Style: Sand Canvas

Kazi et al., 2011; <http://sandcanvas.com/>

Special Artistic Style: Jackson Pollock

- inspired by Jackson Pollock's abstract art
- combination of fluid simulation and interaction
 - simulation of a fluid flowing/dripping down, including splashing effects
 - touch-sensitive interaction hardware to simulate a more realistic environment

Special Artistic Style: Jackson Pollock

**An Interactive 3d Fluid Jet
Painting System**

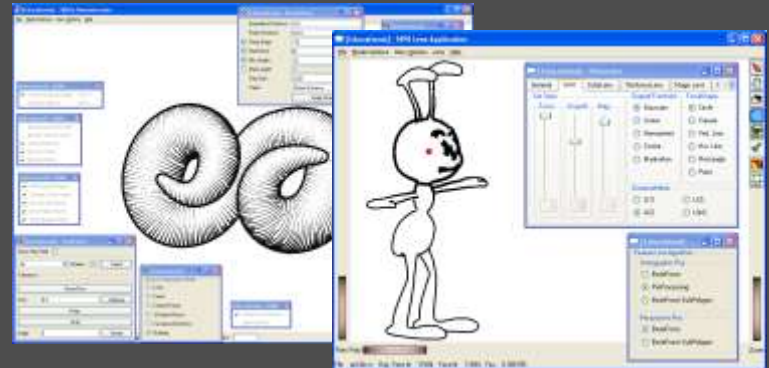

Interacting with NPR

Triggering Algorithmic Response

Triggering Algorithmic Response

- interaction with NPR techniques and algorithms
 - direct control of parameters through traditional interface elements (check boxes, sliders, values, buttons, ...)
 - use of alternative interaction platforms, often inspired by traditional artistic media (touch-displays, brushes, cloth, dripping paint, ...)
- other techniques: use automatic NPR method and indirect, higher-level control over the outcome

Painterly Rendering for Video

- indirect control of a painterly rendered video stream
- interaction: control of the source video stream
- automatic painterly rendering
 - look at changes in the video
 - paint over the parts that change
 - optical flow to associate successive frames, moving existing strokes appropriately
 - results in “live painting”
 - off-line processing also possible

Painterly Rendering for Video

Triggering Algorithmic Response

- high- vs. low-level control
 - programmers tend to expose numerous parameters in interfaces
 - higher-level control often more interesting for artists
- many artistic pieces could be seen as NPR algorithms
 - e.g., “Wooden Mirror” by Daniel Rozin like animated interactive mosaic rendering, similar to painterly rendering for video
 - some more examples

“Wooden Mirror” by Daniel Rozin

Human-Guided Genetic Search

- idea: use human opinion to guide genetic algorithm
 - decision what is better or worse sometimes hard to encode in an energy function
 - let a person decide: rate a selection
 - iterative refinement until the desired goal is reached
 - result: goal-centered evolutionary search

Empathic Painting

- control of painterly rendering through the viewer's emotional state
 - tracking of facial features
 - mapping to positions in space of prototypical emotional states
 - mapping of mood to parameters of rendering algorithm (color scheme, stroke jaggedness, etc.)

Empathic Painting

Interacting with NPR

Other Related Approaches

Approaches Related to Interactive NPR

- sketch-based modeling (SBM)
 - traditional sketching often for initial designs
 - interactive, computer-supported sketching
- NPR to support sketch-based modeling
 - drawing both inspiration for NPR and SBM
 - sketchiness to emphasize the status of initial design
 - inspiration from iterative drawing practices
 - visual scaffolding: geometric massing, eraser marks
- stroke-based modeling
 - the stroke as modeling primitive
 - drawing to design in 3D space

Sketch-Based Modeling: Teddy

- sketching for quick and easy design of freeform models
- technique:
 - draw silhouette & extrude
 - other modeling operations possible: cutting, surface detail, bending, distortion
 - extrusion by inflating shapes

Igarashi et al., 1999

Sketch-Based Modeling: Teddy

Teddy: A Sketching Interface for 3D Freeform Design

Takeo Igarashi
Hidehiko Tanaka
Satoshi Matsuoka

Igarashi et al., 1999

Sketch-Based Modeling

- problems & issues of sketch-based modeling
 - typically under-constrained problem:
2D drawing converted into 3D shape
 - use of reasonable defaults
 - use of interactive techniques to change these
 - use of 3D “sketching” input
 - lack of precision due to inherent imprecision
 - use of constrained interaction techniques
 - sketchy character of results (sometimes)
 - use as an advantage
 - use for prototyping applications

Sketch-Based Modeling

- interactive 3D modeling procedure
 - use of elements from real sketches
 - sketching interaction
 - representation (line drawings)
 - visual scaffolding: geometric massing, eraser marks
- visual history of the modeling process

Schmidt et al., 2007

Sketch-Based Modeling: Example

Schmidt et al., 2007

Stroke-Based Modeling

- traditional stroke-based modeling
 - sketching as 2D drawing, converted into 3D shape
 - need to use reasonable defaults, interactive changes
- idea: stroke as the drawing primitive
 - individual lines/strokes often in one plane
 - system to interpret input to adapt to drawing and interaction gestures

Sketch-Based Modeling

Bae et al., 2008

Interacting with NPR

Summary

Interacting with NPR

- interaction is not evil or a last resort!
- interaction is necessary for control over the result
 - fully automatic is nice, but not satisfying for artists
 - interfaces need to be intuitive, need to support creativity
 - should not be used as an excuse
- many forms of interaction possible
 - depend on type of NPR technique
 - depend on type of hardware/platform
 - depend on application and goal
